

# ARCH 314 STRUCTURE I

RECITATION SESSION 1  
FACULTY: Prof. Peter Von Buelow  
GSI: Faezeh Choobkar  
FALL 2025

# Welcome to recitation session

---

## Introduction:

Faezeh Choobkar (PhD student)

Contact: [faezehch@umich.edu](mailto:faezehch@umich.edu)

Office hours: by appointment

## Outline:

Quick Recap

Provide the solution for the assignment (Problem set 1 and 2)

Answering student's questions

Recitation lab: Adding Forces

## Problem Set 1: Dead Load Calculation

### 1. Dead Load Calculation

For the given member cross-section and length, find the DL in PLF of the joist member, total pounds of the member, and PSF DL of the joist on the floor.

DATASET: 1	-2-	-3-
Width: $b$		3.5 IN
Depth: $d$		7.5 IN
Length: $L$		8 FT
On center spacing		24 IN
Species class		Eastern White Pine
Density		22 PCF

## Problem Set 1: Dead Load Calculation

---

#	Question	Your Response	Correct Answer	Score
1	The cross-sectional area: A	<input type="text"/> IN^2	<input type="button" value="SUBMIT"/>	
2	Dead load of joist section	<input type="text"/> PLF	<input type="button" value="SUBMIT"/>	
3	Dead load of whole joist member	<input type="text"/> LBS	<input type="button" value="SUBMIT"/>	
4	Dead load of joists on floor	<input type="text"/> PSF	<input type="button" value="SUBMIT"/>	

**Q1:**

$$\begin{aligned} \text{Cross sectional area} &= b \times d \\ &= 3.5 \text{ in} \times 7.5 \text{ in} \\ &= 26.25 \text{ in}^2 \end{aligned}$$

## Problem Set 1: Dead Load Calculation

#	Question	Your Response	Correct Answer	Score
1	The cross-sectional area: A	<input type="text"/> IN^2	<input type="button" value="SUBMIT"/>	
2	Dead load of joist section	<input type="text"/> PLF	<input type="button" value="SUBMIT"/>	
3	Dead load of whole joist member	<input type="text"/> LBS	<input type="button" value="SUBMIT"/>	
4	Dead load of joists on floor	<input type="text"/> PSF	<input type="button" value="SUBMIT"/>	

**Q2:**

$$\text{Cross sectional area} = 26.25 \text{ in}^2 \times 1/12 \times 1/12 = 0.182 \text{ ft}^2$$

$$\text{Density} = 22 \text{ PCF}$$

$$\text{Volume of joist} = \text{cross sectional area} \times L(\text{per unit length}) = 0.182 \text{ ft}^3$$

$$\text{Dead load of joist section} = \text{Density} \times \text{Volume} = 22 \times 0.182 = 4.010 \text{ PLF}$$

## Problem Set 1: Dead Load Calculation

#	Question	Your Response	Correct Answer	Score
1	The cross-sectional area: A	<input type="text"/> IN^2	<input type="button" value="SUBMIT"/>	
2	Dead load of joist section	<input type="text"/> PLF	<input type="button" value="SUBMIT"/>	
3	Dead load of whole joist member	<input type="text"/> LBS	<input type="button" value="SUBMIT"/>	
4	Dead load of joists on floor	<input type="text"/> PSF	<input type="button" value="SUBMIT"/>	

**Q3:**

Cross sectional area= $26.25 \text{ in}^2 \times 1/12 \times 1/12 = 0.182 \text{ ft}^2$   
Density=22 PCF  
Dead load of joist section= 4.010 PLF  
Dead load of whole joist member=  $4.010 \times 8 = 32.08 \text{ LBS}$

## Problem Set 1: Dead Load Calculation

---

#	Question	Your Response	Correct Answer	Score
1	The cross-sectional area: A	<input type="text"/> IN^2	<input type="button" value="SUBMIT"/>	
2	Dead load of joist section	<input type="text"/> PLF	<input type="button" value="SUBMIT"/>	
3	Dead load of whole joist member	<input type="text"/> LBS	<input type="button" value="SUBMIT"/>	
4	Dead load of joists on floor	<input type="text"/> PSF	<input type="button" value="SUBMIT"/>	

Q4:

Dead load of joist section= 4.010 PLF  
Surface=  $(24/12) \times 8 = 16 \text{ ft}^2$   
Dead load of joist on floor =  $32.08 \div 16 = 2.005 \text{ PSF}$

## Problem Set 2: Three Vector Addition

Find the horizontal and vertical components of each of the three forces shown. Then find the resultant of all forces and the angle measured counter-clockwise from the + x-axis.

DATASET: 1

-2-

-3-

Force A	21 LBS
Angle A	7 DEGREES
Force B	68 LBS
Angle B	210 DEGREES
Force C	39 LBS
Angle C	284 DEGREES

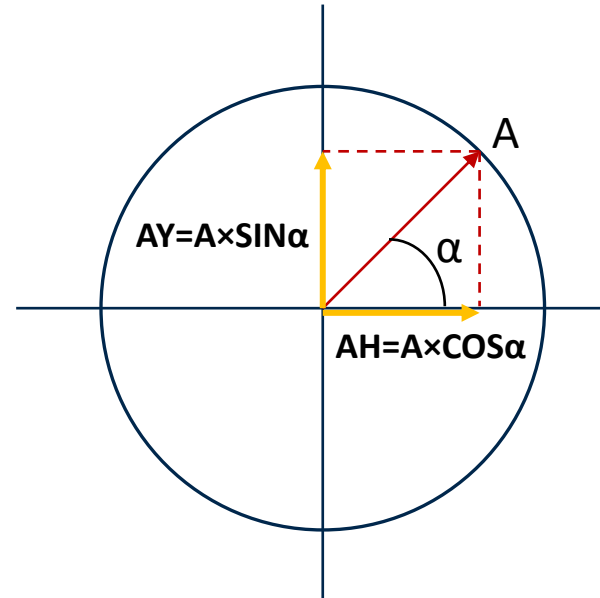

## Problem Set 2: Three Vector Addition

---

#	Question	Your Response	Correct Answer
1	Horizontal component of Force A (+ to right: - to left)	<input type="text"/> LBS	<input type="button" value="SUBMIT"/>
2	Vertical component of Force A (+ upward: - downward)	<input type="text"/> LBS	<input type="button" value="SUBMIT"/>
3	Horizontal component of Force B (+ to right: - to left)	<input type="text"/> LBS	<input type="button" value="SUBMIT"/>
4	Vertical component of Force B (+ upward: - downward)	<input type="text"/> LBS	<input type="button" value="SUBMIT"/>
5	Horizontal component of Force C (+ to right: - to left)	<input type="text"/> LBS	<input type="button" value="SUBMIT"/>
6	Vertical component of Force C (+ upward: - downward)	<input type="text"/> LBS	<input type="button" value="SUBMIT"/>
7	Sum of horizontal components (+ to right: - to left)	<input type="text"/> LBS	<input type="button" value="SUBMIT"/>
8	Sum of vertical components (+ upward: - downward)	<input type="text"/> LBS	<input type="button" value="SUBMIT"/>
9	Resultant of Forces A + B + C (absolute value)	<input type="text"/> LBS	<input type="button" value="SUBMIT"/>
10	Angle of the Resultant in DEGREES from + x axis counterclockwise	<input type="text"/> DEGREES	<input type="button" value="SUBMIT"/>

## Problem Set 2: Three Vector Addition

---

## Problem Set 2: Three Vector Addition

$\cos(210) = \cos(180+30) = -\cos(30)$

**Q1-8:**

Force A	21 LBS
Angle A	7 DEGREES
Force B	68 LBS
Angle B	210 DEGREES
Force C	39 LBS
Angle C	284 DEGREES

Force	Horizontal	Vertical
A	$21 \times \cos(7) = +20.84$	$21 \times \sin(7) = +2.56$
B	$68 \times \cos(210) = -58.89$	$68 \times \sin(210) = -34$
C	$39 \times \cos(284) = +9.43$	$39 \times \sin(284) = -37.9$
SUM	-28.62	-69.34

## Problem Set 2: Three Vector Addition

Q9:

$$F_R = \sqrt{F_x^2 + F_y^2}$$

$$= \sqrt{(-28.62)^2 + (-69.34)^2} = 75.014$$

Q10:

$$\tan \alpha = \frac{F_x}{F_y}$$

$$\alpha = \tan^{-1} \frac{F_x}{F_y}$$

$$= 67.56 + 180 = 247.56$$

## Adding Forces

### LAB

---

#### Description

This project is intended to give a sense how forces combine in a system of equilibrium. A selection of 3 force equilibrium systems are modeled both physically and graphically to verify hand calculations.

#### Goals

To model two component forces of an equilibrant in tension using a physical model.  
To show the vector addition of the same 2 forces to find the resultant  
To make hand calculations of the same vector addition.

#### Procedure

1. Using a piece of string with some weight tied to the middle; hold the two string ends at  $0^\circ$  and  $90^\circ$  (horizontal and vertical). Observe that the horizontal is slack (no force in the string). Your hand on the vertical string is the equilibrant force to the force of gravity acting on the weight.
2. Move the vertical string so one string is at  $45^\circ$  and the other at  $0^\circ$  (horizontal).
3. Make a scaled sketch of equilibrant force (opposite to the weight) and its 2 component forces (the two strings in your hands). Scale the *force* not the string. Assume the weight to be 10 units. Scale the forces on the graph paper and estimate the force magnitude of each of the two component forces.
4. Use either trigonometry or similar triangles to calculate the forces in the strings. Compare your results with the graphic result.
5. Try another variation like the third figure below.
6. Try to pull the 2 strings horizontal (don't break the string). Observe that there tends to be a small sag in the string even when pulled fairly taught.
